(Work in Progress) QB Tailings & Water — Operational Process & Performance Measurement Architecture

Conceptual process boundaries, material and water flows, and associated operational reporting metrics.

PROPOSED REVISION — QB validation required

This second page is a proposed process and measurement map. The first page retains the original work-in-progress drawing. The sand-dam prism is treated as cyclone-sand construction (regional convention); rock benches and rockfill are separate construction inputs. Do not interpret the dashed seepage-to-RWS connection as verified plant routing.

Suggested high-level reporting: prioritize capacity constraint / safe operating margin and construction progress to plan. Retain bench, prism, paddock, lagoon and geotechnical details at site technical level unless exceptions materially affect operations. Source: Teck QB TMF disclosure, Teck QB action plan, SERNAGEOMIN operating guide; verify with QB.
